

# IDWS 4.0 Quick Start Guide

## By VIN

1) For returns of multiple vehicles, the entire configuration is returned for all records. Not all major equipment may be selected, as some OEM's do not call these out with the VIN pattern

2) Review to make sure all major equipment and desired options are selected. If not, you will need to make changes to the equipment within your application/display. If the engine, drivetrain or transmission is not determined, you will have to code for the end-user to select the correct ones from the list available. If you want the end-user to make other equipment changes (adding or removing), you will need to make those selectable as well.

3) When changing equipment, desired selections are sent into the service and validated, and their relationships taken into consideration. This logic is completely handled on the backend by the service. Additional changes may be needed based on Response.

4) Values are returned based off of correct vehicle configuration, mileage and zip code.
