

IDWS 4.0 Quick Start Guide

By Year/Make/Model

1) There are certain vehicles that do not have values assigned to them yet, and will only show up under the "Dealer" category. If you are displaying information on a Consumer facing website, you cannot display these vehicles. For other implementations you would need to pass in "Dealer" to get the vehicle information.

2) Review to make sure all major equipment and desired options are selected. If not, you will need to make changes to the equipment within your application/display. If you want the end-user to make equipment changes (adding or removing), you will need to code for the options to be selectable.

3) When changing equipment, desired selections are sent into the service and validated, and their relationships taken into consideration. This logic is completely handled on the backend by the service. You may need to make additional changes based on the Response,

4) Values are returned based off of correct vehicle configuration and zip code.
